

Agentic AI in Supply Chain

Autonomous agents for resilient and intelligent supply chains.

Programme level	Graduate, Postgraduate	Duration	10 weeks
Credits	3	Delivery	Classroom, Online, Hybrid
Subject area	Agentic AI in Supply Chain	Updated	2026-07-21

Course overview

A specialised course on designing, evaluating and governing AI agents across planning, procurement, logistics, inventory and supply-chain control processes.

Intended audience: Supply-chain, operations and engineering management students and professionals exploring intelligent workflow automation.

Prerequisites: Introductory knowledge of supply-chain processes; prior AI experience is not required.

Learning outcomes

- Map supply-chain decisions suitable for AI-agent support.
- Design agent roles, tools, data access and human controls.
- Evaluate reliability, coordination and operational risk.
- Develop performance measures for agent-enabled workflows.
- Propose a phased implementation for a supply-chain use case.

Module structure

01	Supply-chain decisions and agent opportunities Planning, procurement, inventory, logistics and service.
02	Agent design and workflow orchestration Roles, tools, memory, hand-offs and escalation.
03	Data and enterprise-system integration Operational data, APIs and process constraints.
04	Reliability, controls and governance Human oversight, exception handling and accountability.
05	Pilot design and scale-up Metrics, operating change and implementation roadmap.

Assessment pattern

Assessment component	Weight
Process opportunity map	25%
Agent workflow design	35%
Supply-chain pilot proposal	40%

Delivery note

The module sequence, class activities and assessment details may be adapted for programme schedules, cohort experience and institutional requirements. The course remains focused on practical application, structured judgement and professional communication.
